

# Shape optimization of the MIRA Reference CAR

Gianluca Orso Fiet  
MIRA UK

# Introduction

The application of a CFD-optimisation process in the Automotive Industry could be beneficial for:

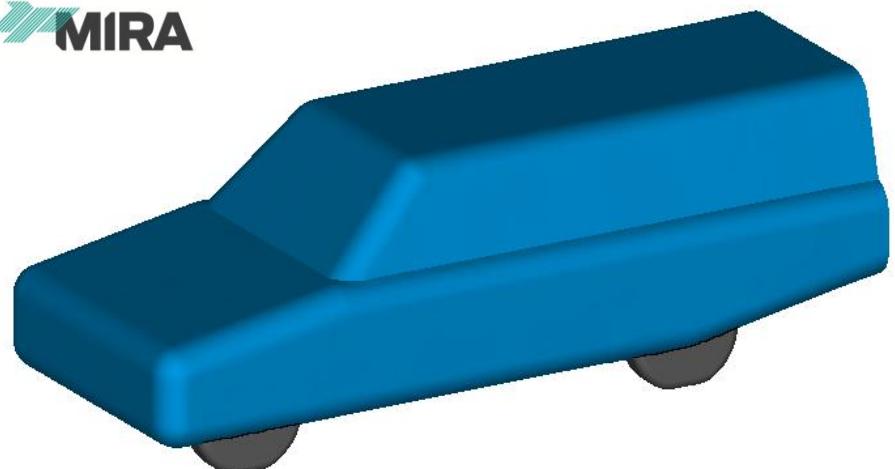

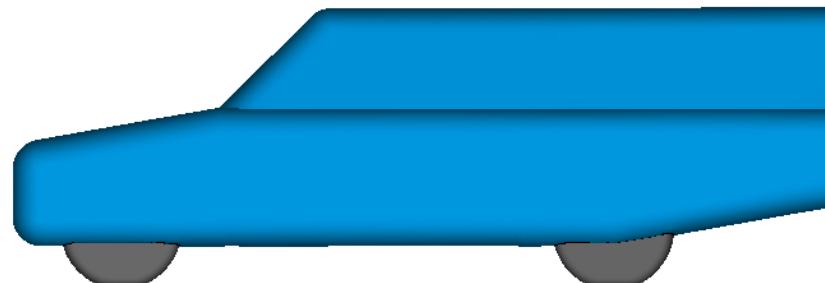

- reducing overall development time
- generating a robust design in early stages of a project

# Test Case Description

## MIRA Reference Car

Idealised vehicle geometry with three modular back-shapes.  
Estate-back configuration was used for this study.

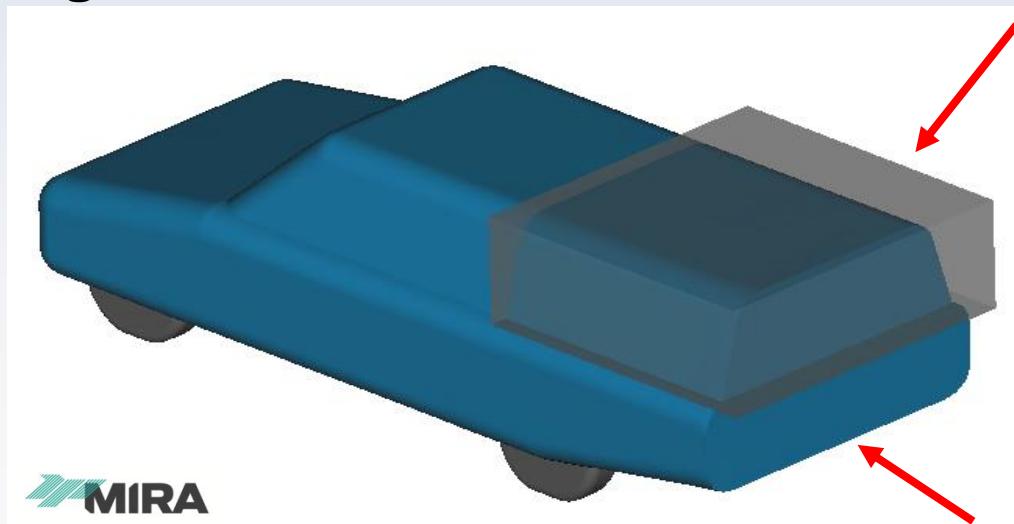

# Target of the Study

The main target of the morphing/optimisation process was to reduce drag while keeping a required level of downforce ( $CL=-0.2$ ).

The exterior shape of the vehicle was modified by:

1. Boat-tailing of top rear back
2. Changing the angle of roof
3. Changing angle of rear diffuser

# Target of the Study

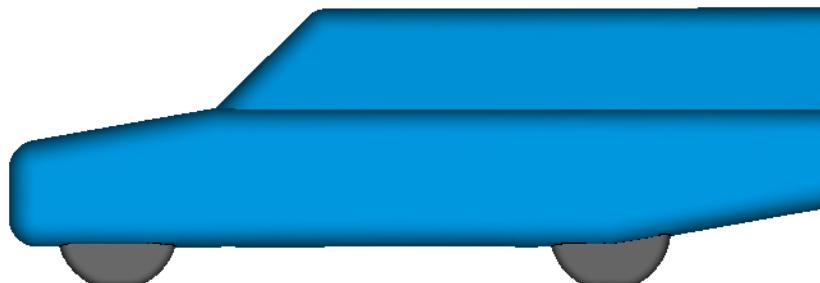

The main target of the morphing/optimisation process was to reduce drag while keeping a required level of downforce (CL=-0.2).

The exterior shape of the vehicle was modified by:

1. Boat-tailing of top rear back
2. Changing the angle of roof
3. Changing angle of rear diffuser

Initial Shape

# Target of the Study

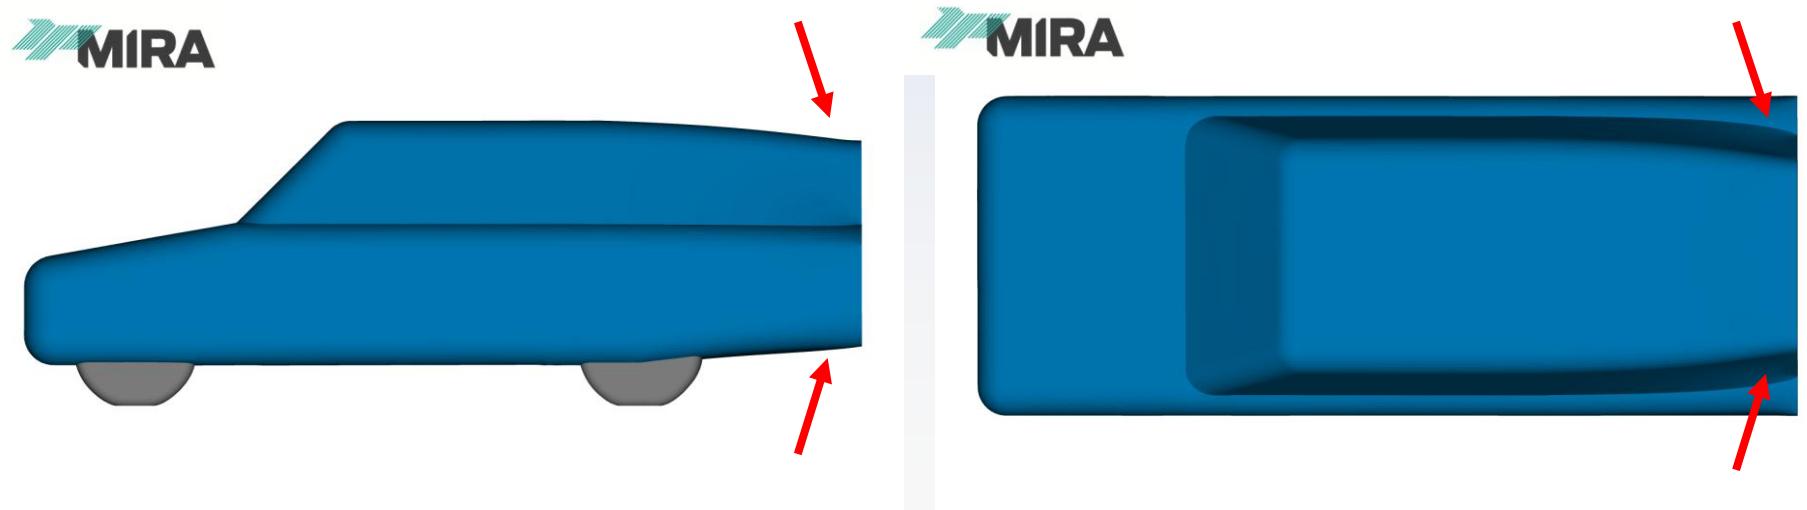

The main target of the morphing/optimisation process was to reduce drag while keeping a required level of downforce (CL=-0.2).

The exterior shape of the vehicle was modified by:

1. Boat-tailing of top rear back
2. Changing the angle of roof
3. Changing angle of rear diffuser

Morphed Shape

# Solution strategy

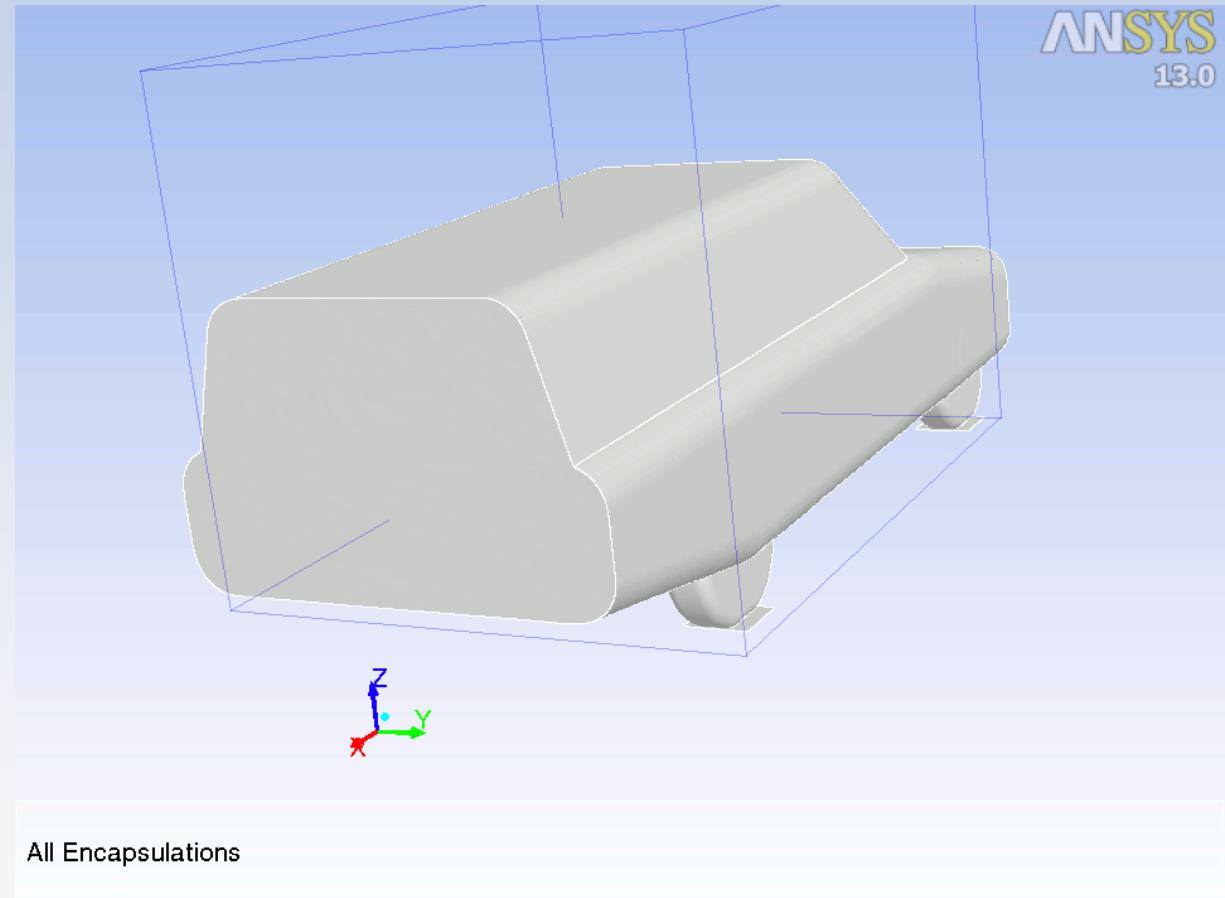

1. Shape modifiers are defined in RBF Morph
2. Full Factorial DOE set-up using RBF Morph (**27 design points to be fully calculated**)
3. Batch solution (using a single case and .rbf & .sol file of each shape, symbolic links in DOE folders)
4. Post processing using a MathCAD worksheet for the evaluation of Response Surface (RS); RS is evaluated using RBF in generic n-dimensional spaces
5. Optimal point detection exploring metamodel in a fine DOE (about 70000 designs explored in a few seconds!)
6. New CFD run at optimal point (**minimum drag with downforce constraint**)

# Solution: shape 1

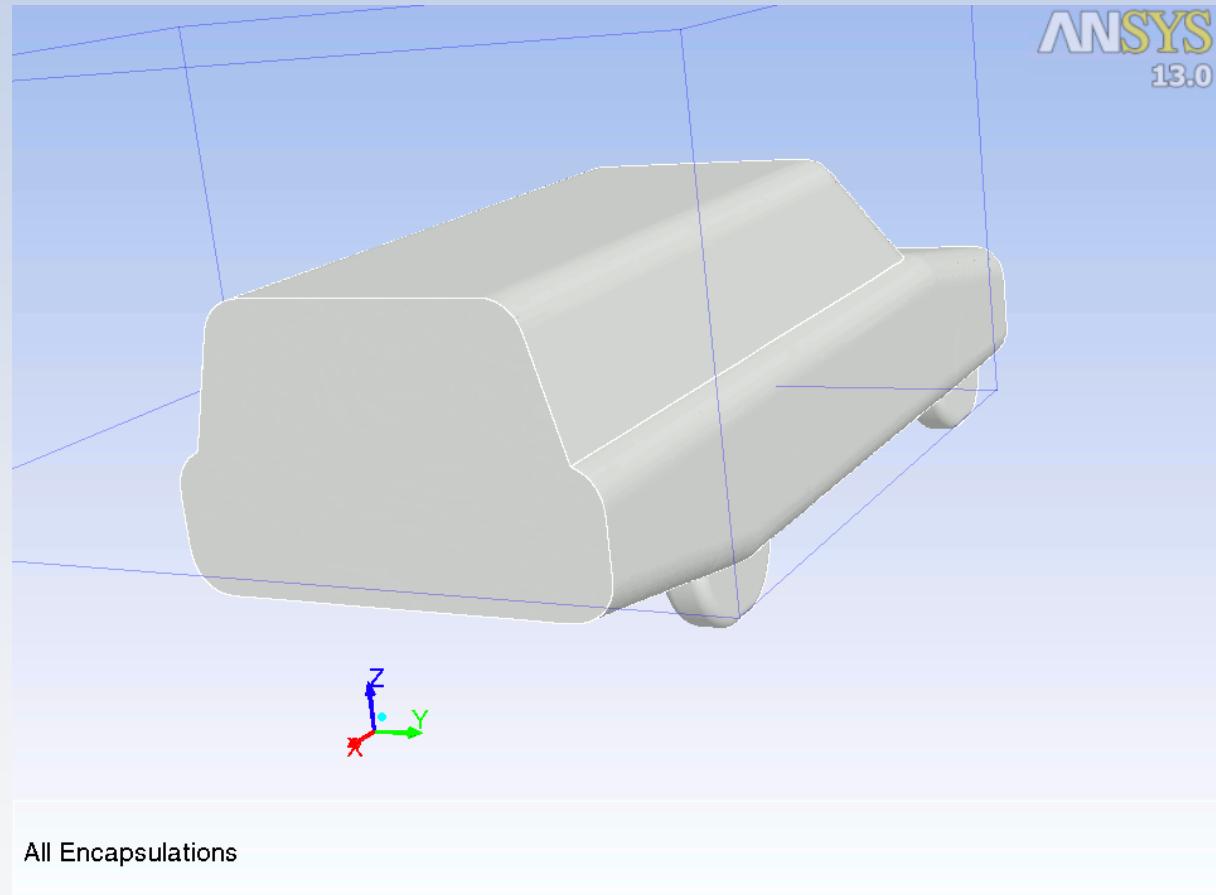

- Shape 1 “back”
- 1 Domain box
- Surface controlled moving side edges
- Sym option activated
- 1184 RBF points
- 1 s to fit
- 30 s to morph
- Range [0:1]
- Max amplitude 10cm

# Solution: shape 2

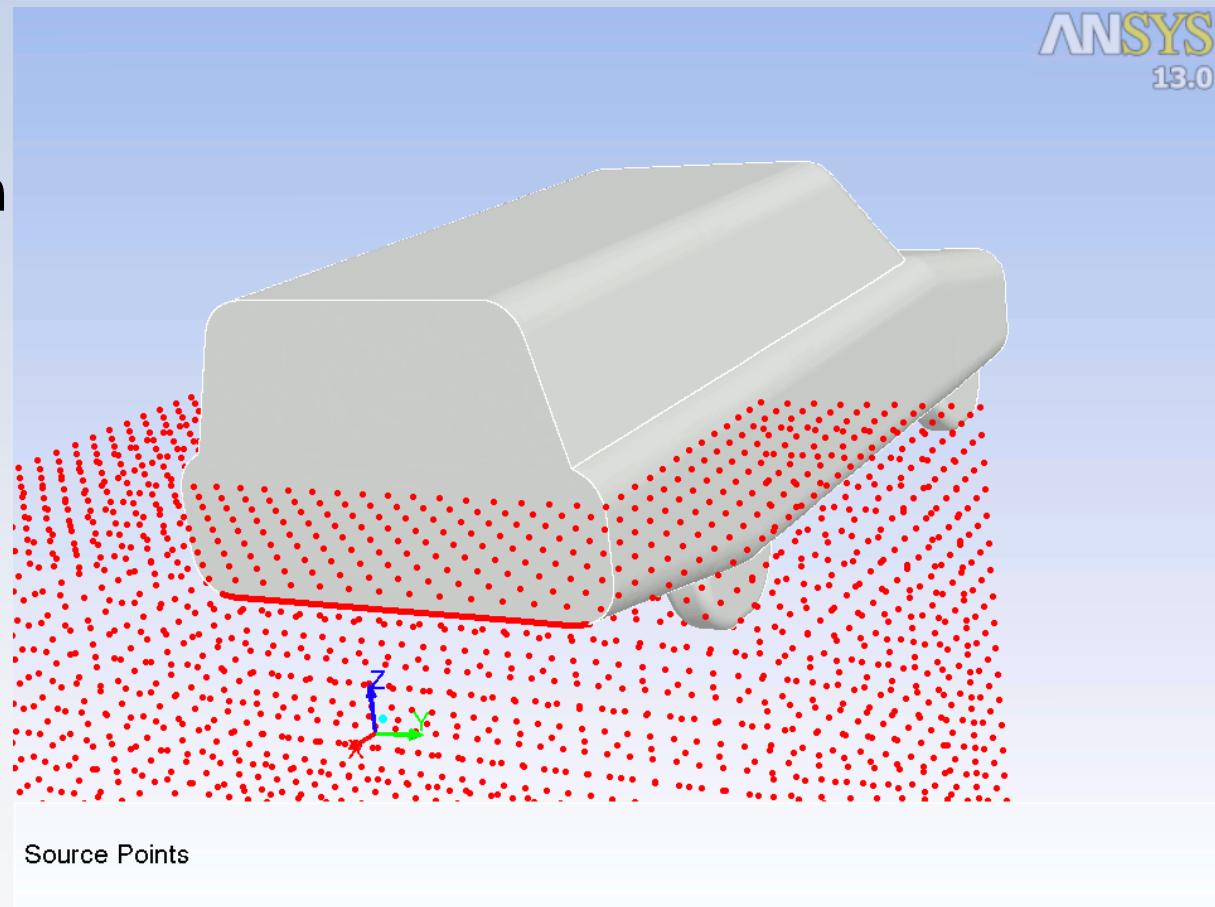

- Shape 2 “roof”
- 1 Domain box
- Surface controlled scaling rear edges
- 6685 RBF Points
- 3 s to fit
- 75 s to morph
- Range [0:1]
- Max amplitude 10.5cm

# Solution: shape 3

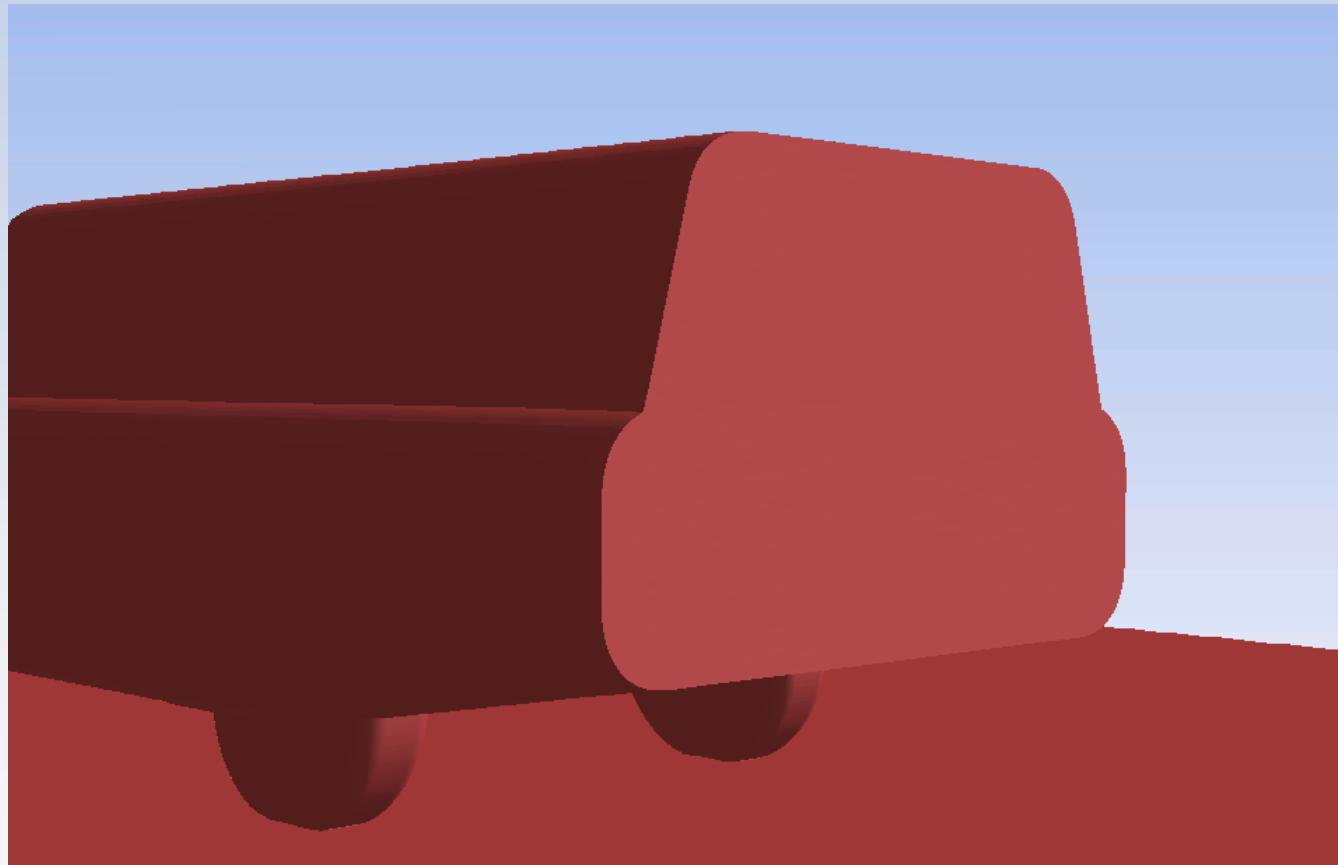

- Shape 3 “diffuser”
- 1 Domain box
- Surface controlled in two steps (edges + RBF sol on Surf)
- Sym option activated
- 33650 RBF Points
- 25 s to fit
- 131 s to morph
- Range [-1:1]
- Max amplitude +/- 10.1cm

# Results: morphing

- First morphing test

ANSYS®

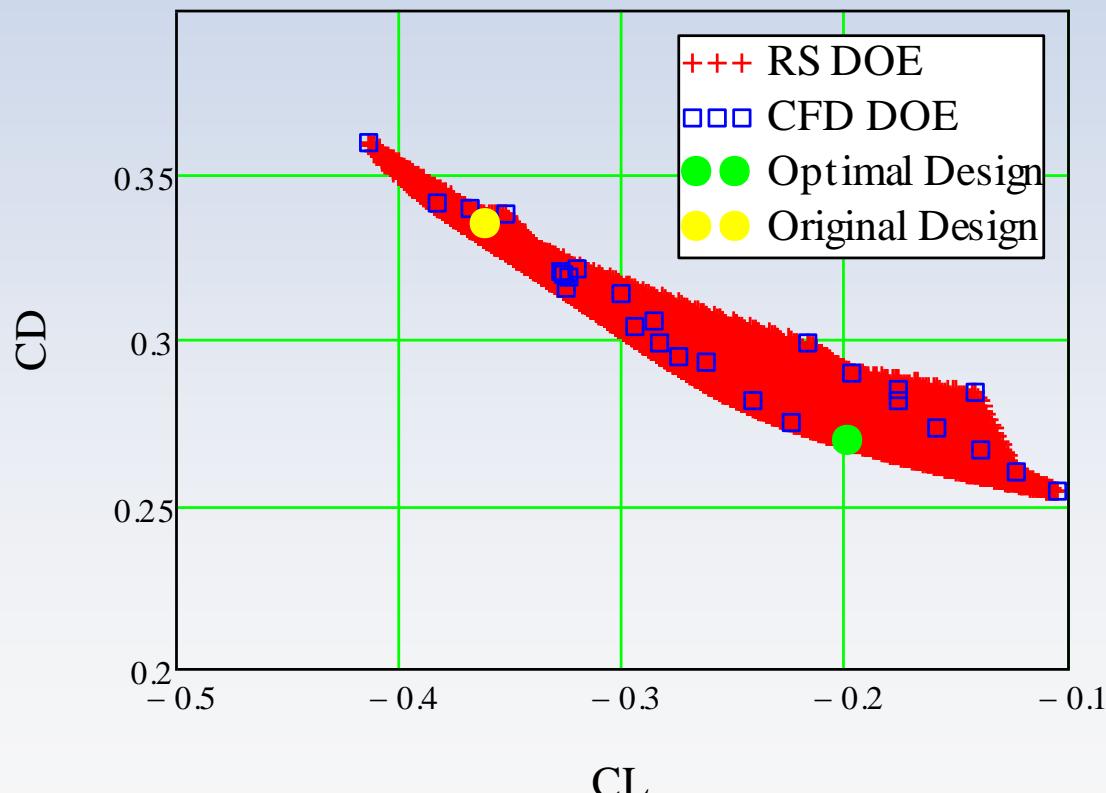

- Sensitivity Analysis (3 inputs, 4 outputs)

# Results: DOE post processing

- Optimal point selection on a fine Full Factorial DOE evaluated on the Response Surface (68921 designs)

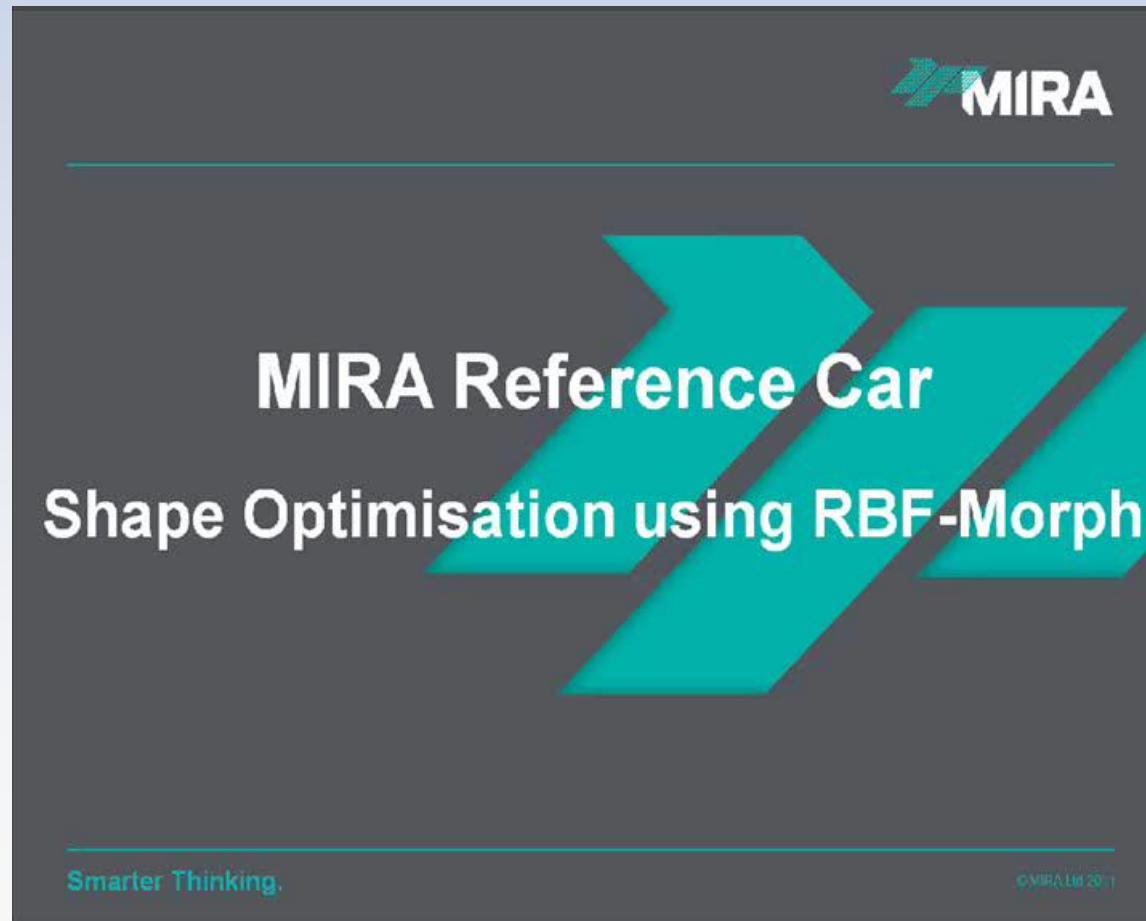

$$\begin{pmatrix} \delta_1 \\ \delta_2 \\ \delta_3 \end{pmatrix} = \begin{pmatrix} 0.875 \\ 1 \\ -0.3 \end{pmatrix} \begin{pmatrix} \text{back} \\ \text{roof} \\ \text{diffuser} \end{pmatrix}$$

$$\text{change} = \begin{pmatrix} -19.686 \\ -45.029 \\ -75.793 \\ 10.292 \\ -56.994 \end{pmatrix} \cdot \% \quad \begin{pmatrix} \text{CD} \\ \text{CL} \\ \text{CMY} \\ \text{CLF} \\ \text{CLR} \end{pmatrix}$$

# Results: CP

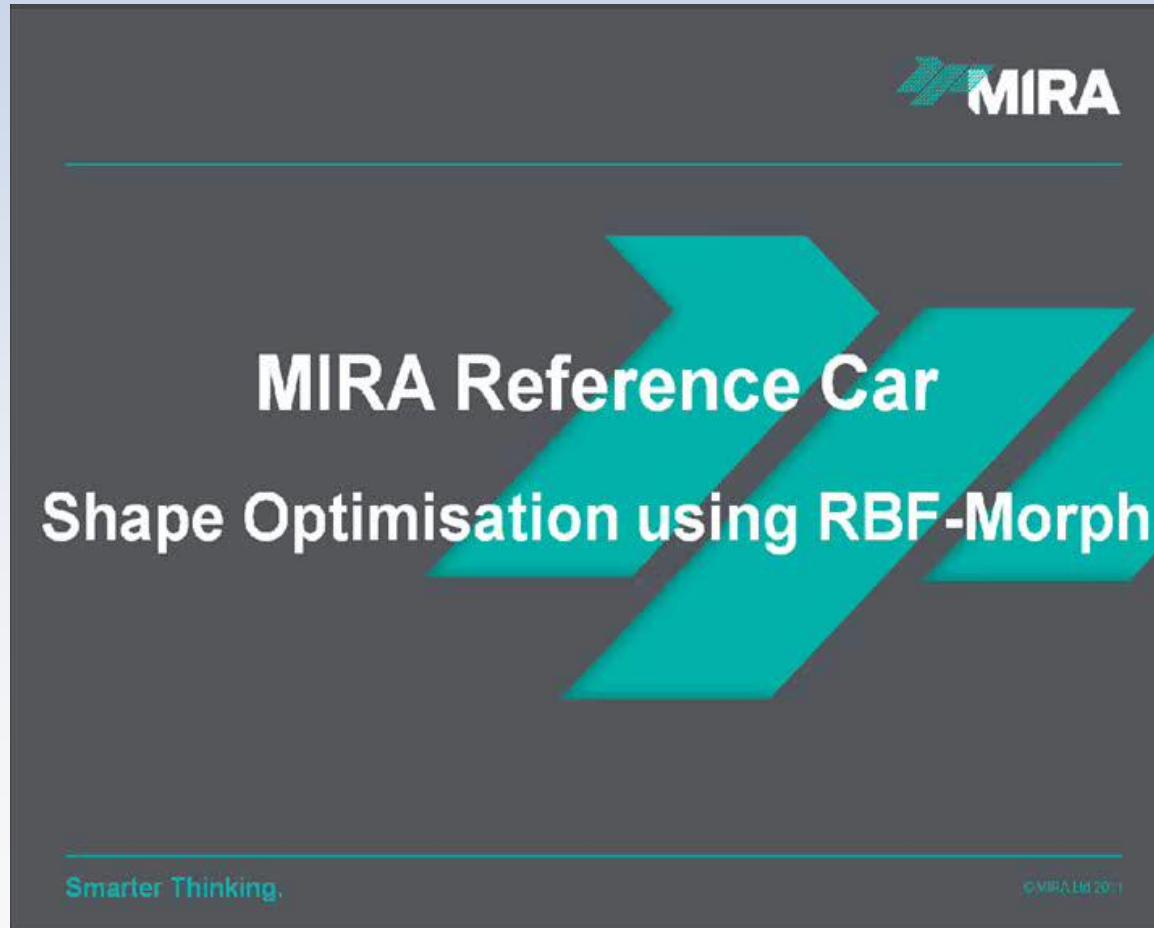

Optimised configuration resulted in 20% drag reduction while maintaining the required level of downforce.

# Results: path-lines

Results from RBF-Morph DOE study showed a very good agreement with trends measured in the MIRA wind tunnel.

# Results: performances

- Mesh generated with SnappyHexMesher – 0.3 hour (clock time)
- Mesh size: 5.2 millions poly cells
- Case set-up – 1 hour
- RBF Morph Set-up – 1 day
- DOE Running set-up – ½ day
- Running - 300 hours (clock time)
- CFD results post-processing – 1 day
- DOE data post-processing – 1 day

## Significant human time reduction for the shape optimisation process:

- Standard Approach – Manual geometry modification and remeshing: **estimated human time from CAD to results  
 $5*27 = 135$  hours**
- RBF-Morph – 1 initial case and mesh morphing: **human time from CAD to results ~ 40 hours**
